Motive - Graph to follow when finding & filling gaps Planning

- Joe Ponsford
- **Forum name:** #Suggestion

One of the most frustrating features of Motive is if you are zoomed close in on the graph and looking at the tangents of the curve, when you press find next gap/previous the graph does not follow. It would be useful if setting start and end points were separate and when you are zoomed in the graph followed regardless of the start/end point.

As the graph act should as a bible for tracking, so this hinders the cleaning of data for speed turnaround which is frustrating. As it is a lot more quicker to identify a swap via a curve tangent than the 3D view-port.
